- 2–Joint Institute of Nuclear Research, Dubna, Russia;

Introduction

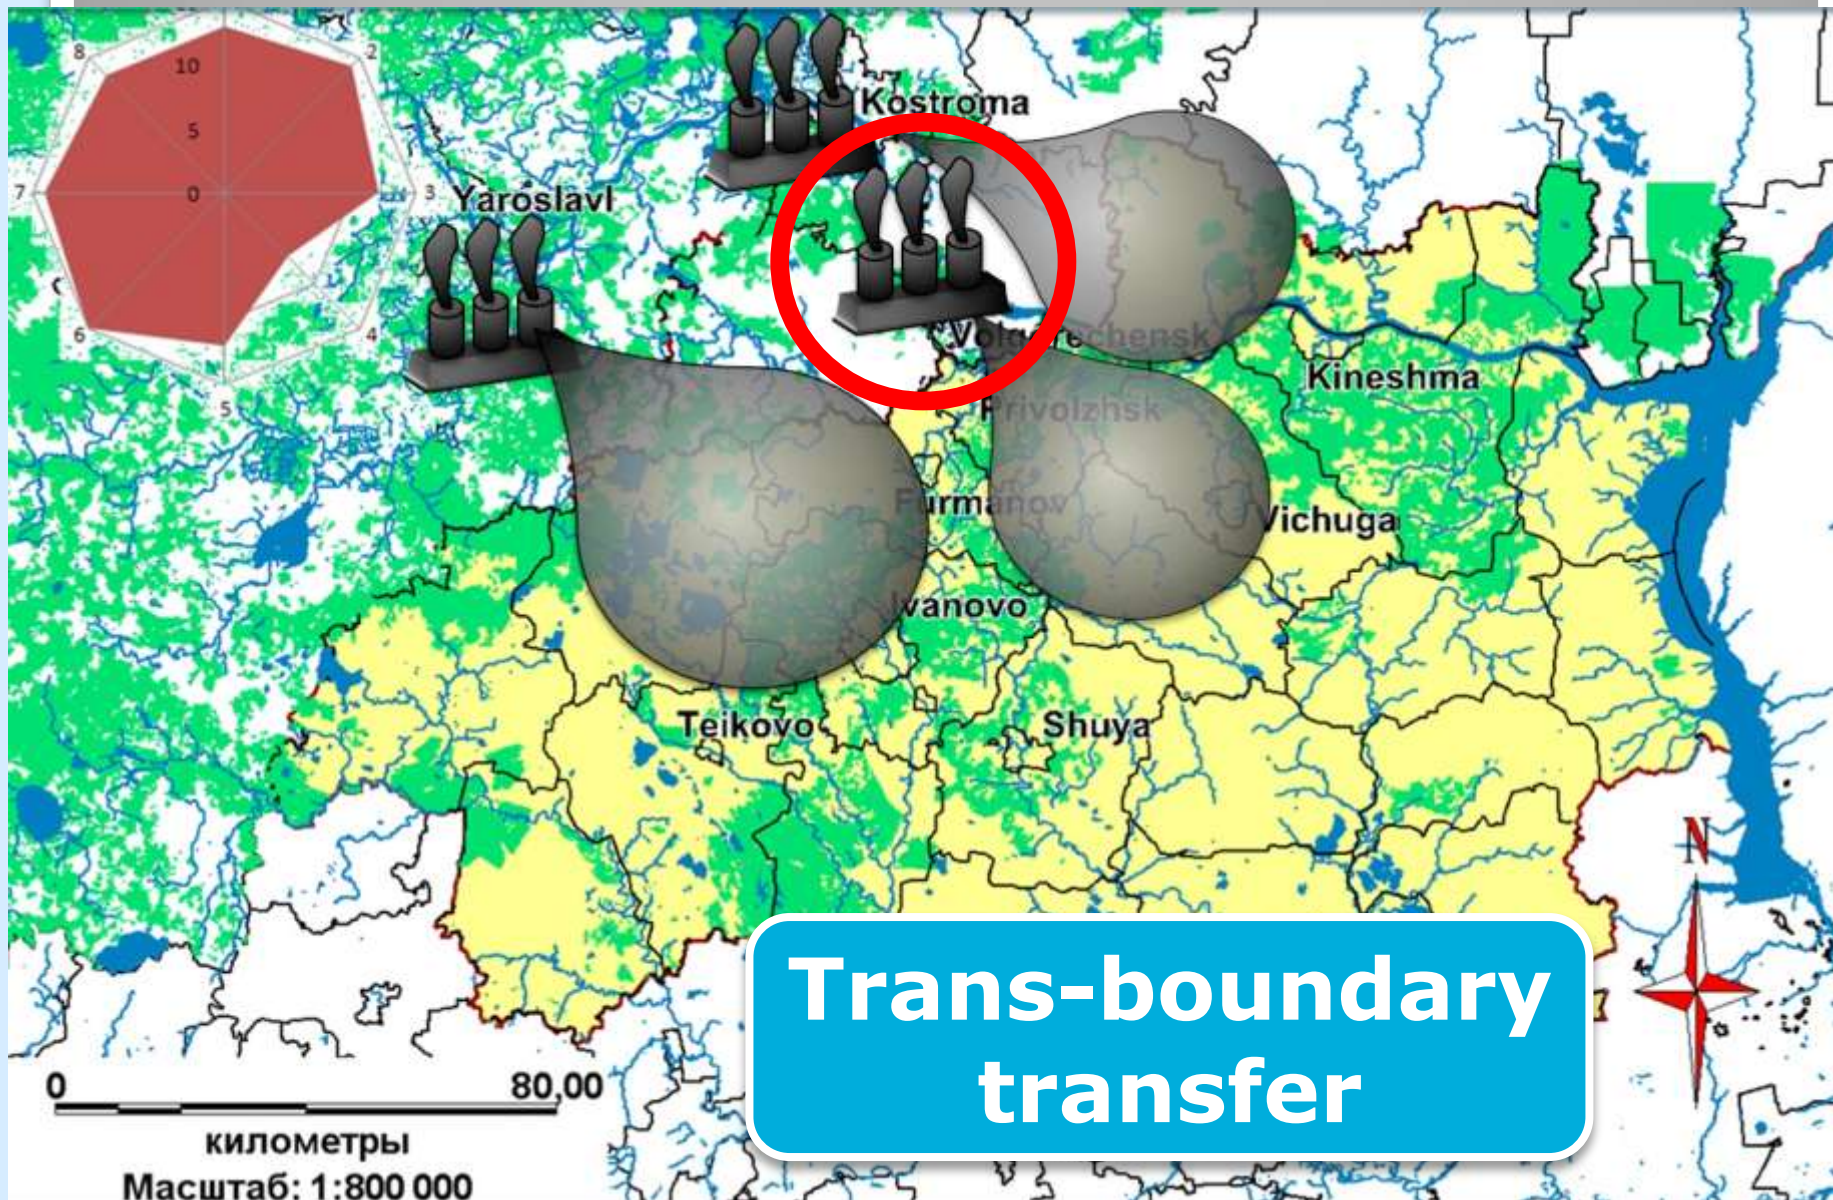

Power industry is one of the leading industries by the level of environmental impact

The monitoring of the effects is an important and urgent problem not only on the local, but also at the regional level

During preparation for the 2010/2011 moss survey, it was found that the area of the Ivanovo region, adjacent to the Kostroma region in the vicinity of the Volgorechensk town, characterized by great level of heavy metal content in mosses and soil

This work is devoted to the detailed study of soil contamination on the territory of foresaid area

The main sources of impact

Sampling map

The map legend:

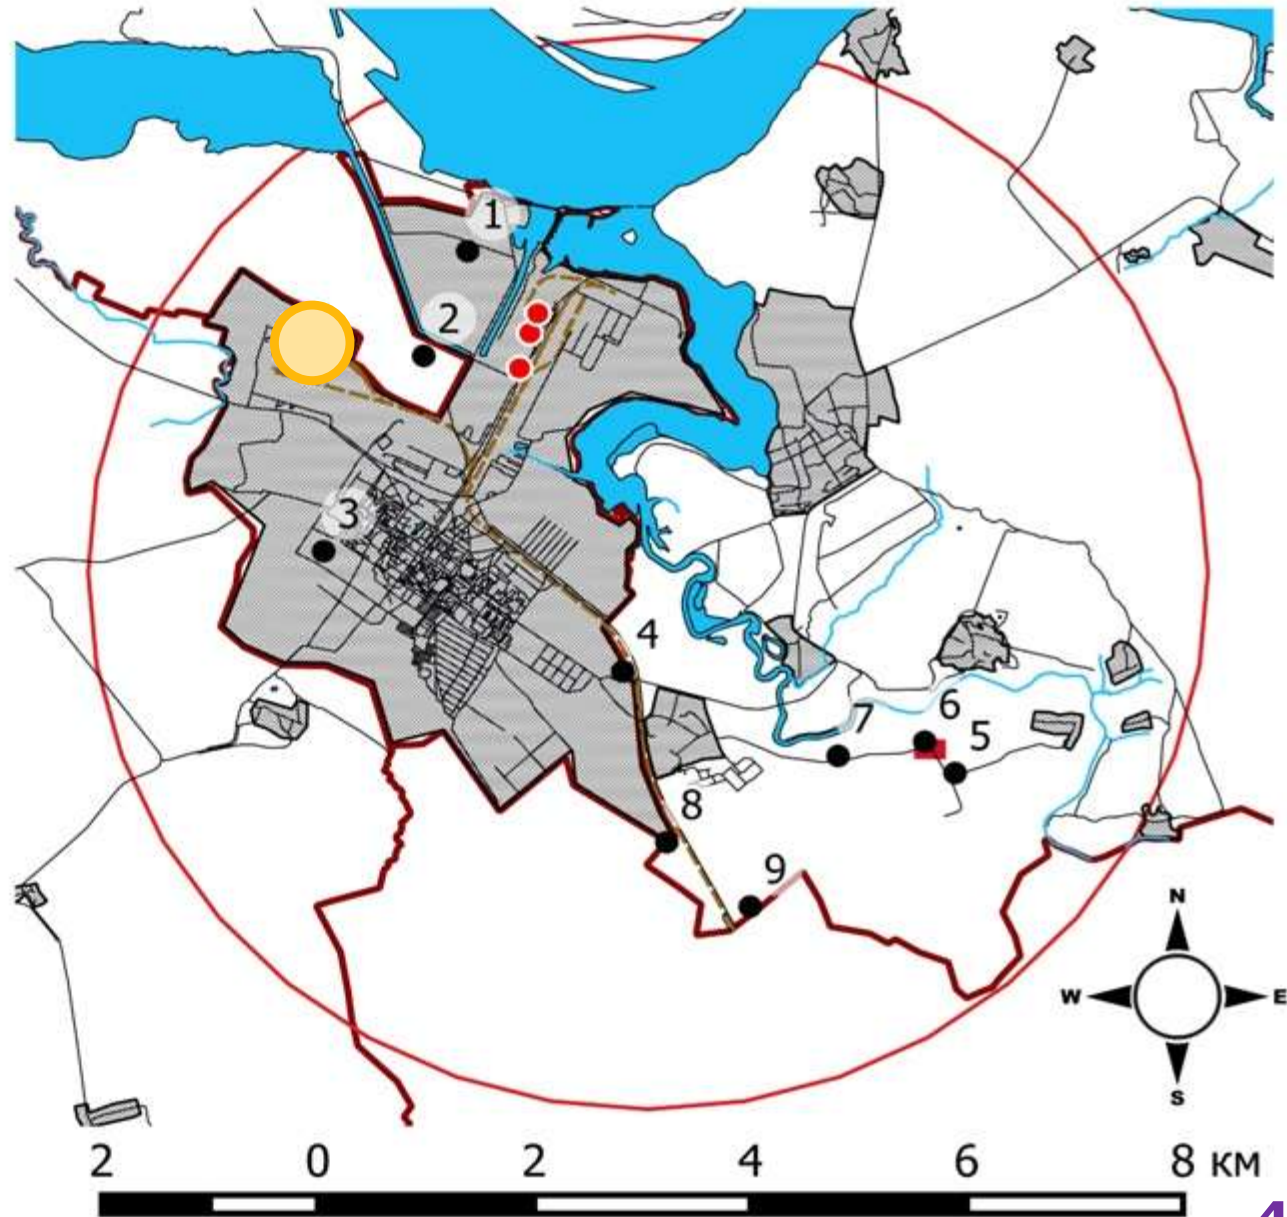

- - Sampling point
- - The power station
- - The town dump
- - Pipe Plant

Population: 16768

| | |
|----------|------|
| Men | 7498 |
| Women | 9275 |
| Children | 2515 |

District Square:
17,8 km²

9 sampling
point

Kostroma's power station characteristics

Electric power: 3600 MW
Thermal power: 450 Gcal / h

Fuel: natural gas
fuel oil

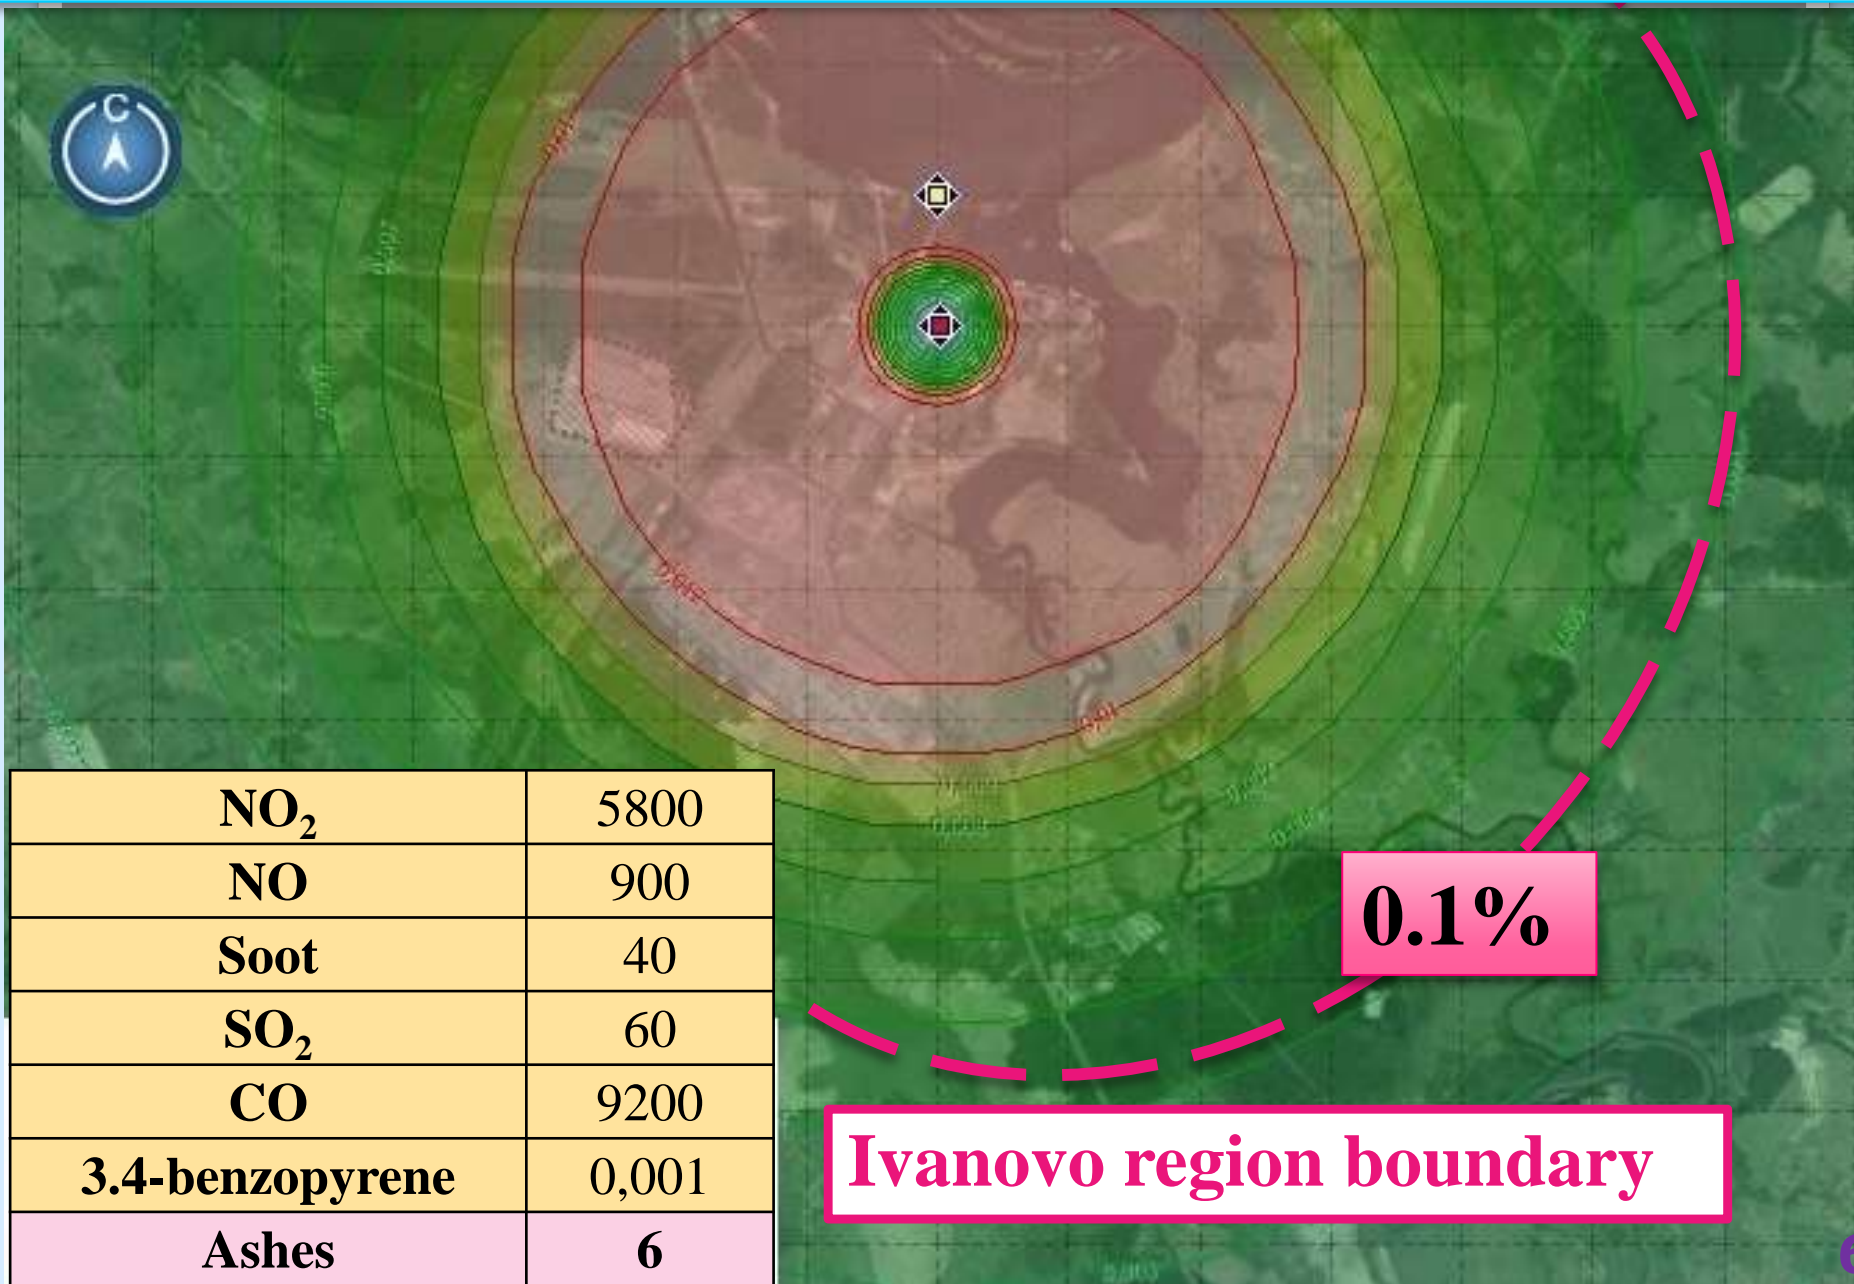

Total emissions:
16000 tons per year

$T_{\text{gas.}} = 150 \text{ C}$

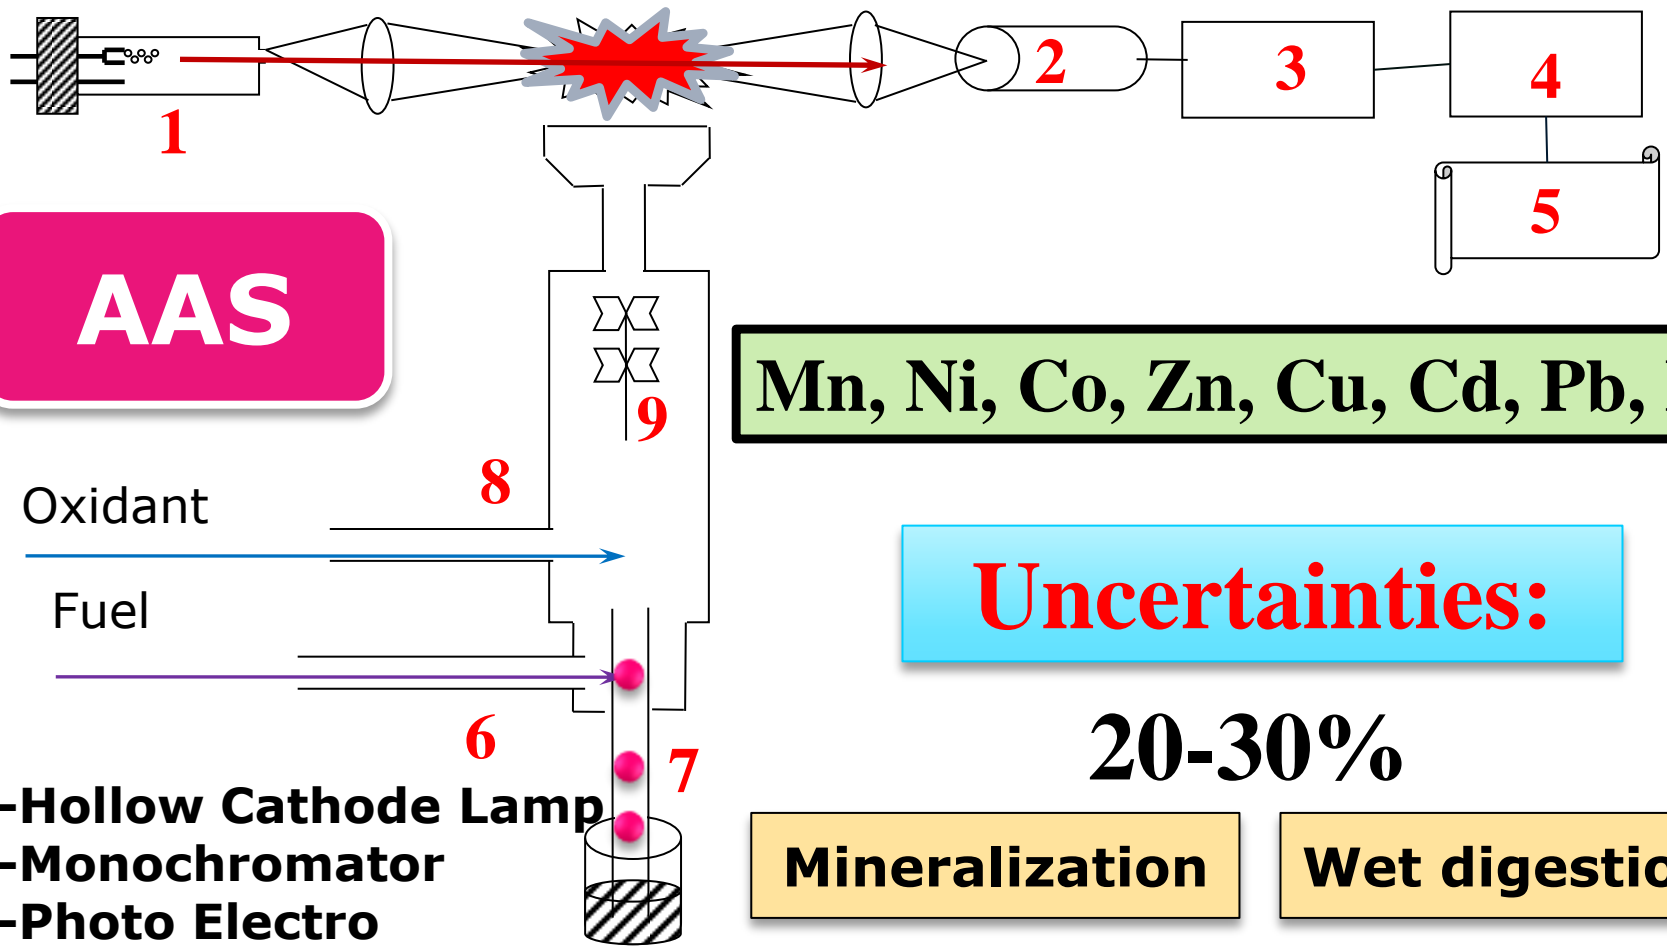

$V = 0.3 \text{ m}^3/\text{sec}$

Total emissions from power station, (ton per year)

Atomic absorption spectroscopy (AAS)

Mn, Ni, Co, Zn, Cu, Cd, Pb, Fe

Uncertainties:

20-30%

Mineralization

Wet digestion

Extraction

1M HNO₃

Buffer pH = 4,8

Estimation of the environmental risk parameters

HM contained in the soil are able to act on the human health in 2 ways:
on skin (in direct contact with the dust),
orally (with dust swallowing)

The calculation was made for **4 groups**:
men, women, children and all adult population

Public health risk

Calculation was carried out using standard technique *

(*Human Health Risk Assessment from Environmental Chemicals. Russian Ministry of Public Health, Moscow, RMPH. 2004. R 2.1.10.1920-04)

Calculation of individual carcinogenic risk (**CR**) :

$$\mathbf{CR = LADD \cdot SF;}$$

(SF_a) – factors of the carcinogenic potential

LADD – average daily lifetime dose

The risk of non-carcinogenic effects (**HQ**)

$$\mathbf{HQ = AD / RfD;}$$

AD - average daily lifetime dose, RfD – reference dose

SF and RfD values are advisory and depend only on the nature of the toxicant and the method of its receipt

Public health risk

Calculation was based on the results of research and census statistical data

Loss in Life Expectancy (LLE).

$$LLE = (T_{cp} - A_{cp}) \cdot (HQ + CR)$$

T_{mean} – average life expectancy of the target population, years;

A_{mean} – the average age of the target group, years;

Economic Damage to Health

(risks and average cost of living):

$$R_{MO} = LLE \cdot N \cdot ALC$$

N – the number of people in the group;

ALC – the average living costs, Eur.

$$ALC = GDP_{RUS} / N_{RUS} \cdot T_{Mean}$$

The total average risks of carcinogenic CR and non-carcinogenic effects HQ (Probability)

| | HQ | CR | P _{summ} |
|-----------------|----------------------|----------------------|----------------------|
| Adults | $2,69 \cdot 10^{-4}$ | $2,50 \cdot 10^{-5}$ | $2,94 \cdot 10^{-4}$ |
| Men | $2,69 \cdot 10^{-4}$ | $2,46 \cdot 10^{-5}$ | $2,93 \cdot 10^{-4}$ |
| Women | $3,06 \cdot 10^{-4}$ | $2,91 \cdot 10^{-5}$ | $3,35 \cdot 10^{-4}$ |
| Children | $1,45 \cdot 10^{-3}$ | $8,42 \cdot 10^{-5}$ | $1,54 \cdot 10^{-3}$ |

10^{-4} - 10^{-3} -Unacceptable risk

Loss in Life Expectancy and Economic Damage to Health

| | LLE, days | R, € |
|-----------------|------------------|-------------|
| Adults | 2,8 | 4386 |
| Men | 2,5 | 3510 |
| Women | 3,6 | 6140 |
| Children | 33 | 52632 |

Conclusions:

-The average metals content in soils practically unchanged at border areas and did not reach the established normative values MPCs, nevertheless it was noted the exceeding of regional background values indicating a increased level of pollution in the area;

-Analysis of obtained data confirms the contribution of power plant activities to the anthropogenic load, and taking into account the wind rose it explains the high content of toxic substances (Zn, Ni, Co) in soils of surrounding areas of the Ivanovo region;

-Analysis of the main parameters of the environmental risk from soil contamination in the Volgorechensk town has revealed a significant level of risk to human health .

Thank you for attention
