# The measurements and applications of photoneutrons induced by an e-linac

**Yigang Yang**

Tsinghua University, Beijing, China

*yangyigang@mail.tsinghua.edu.cn*

# Outline

- 1. Research motivation**
2. e-LINAC based materials detection
3. Summary

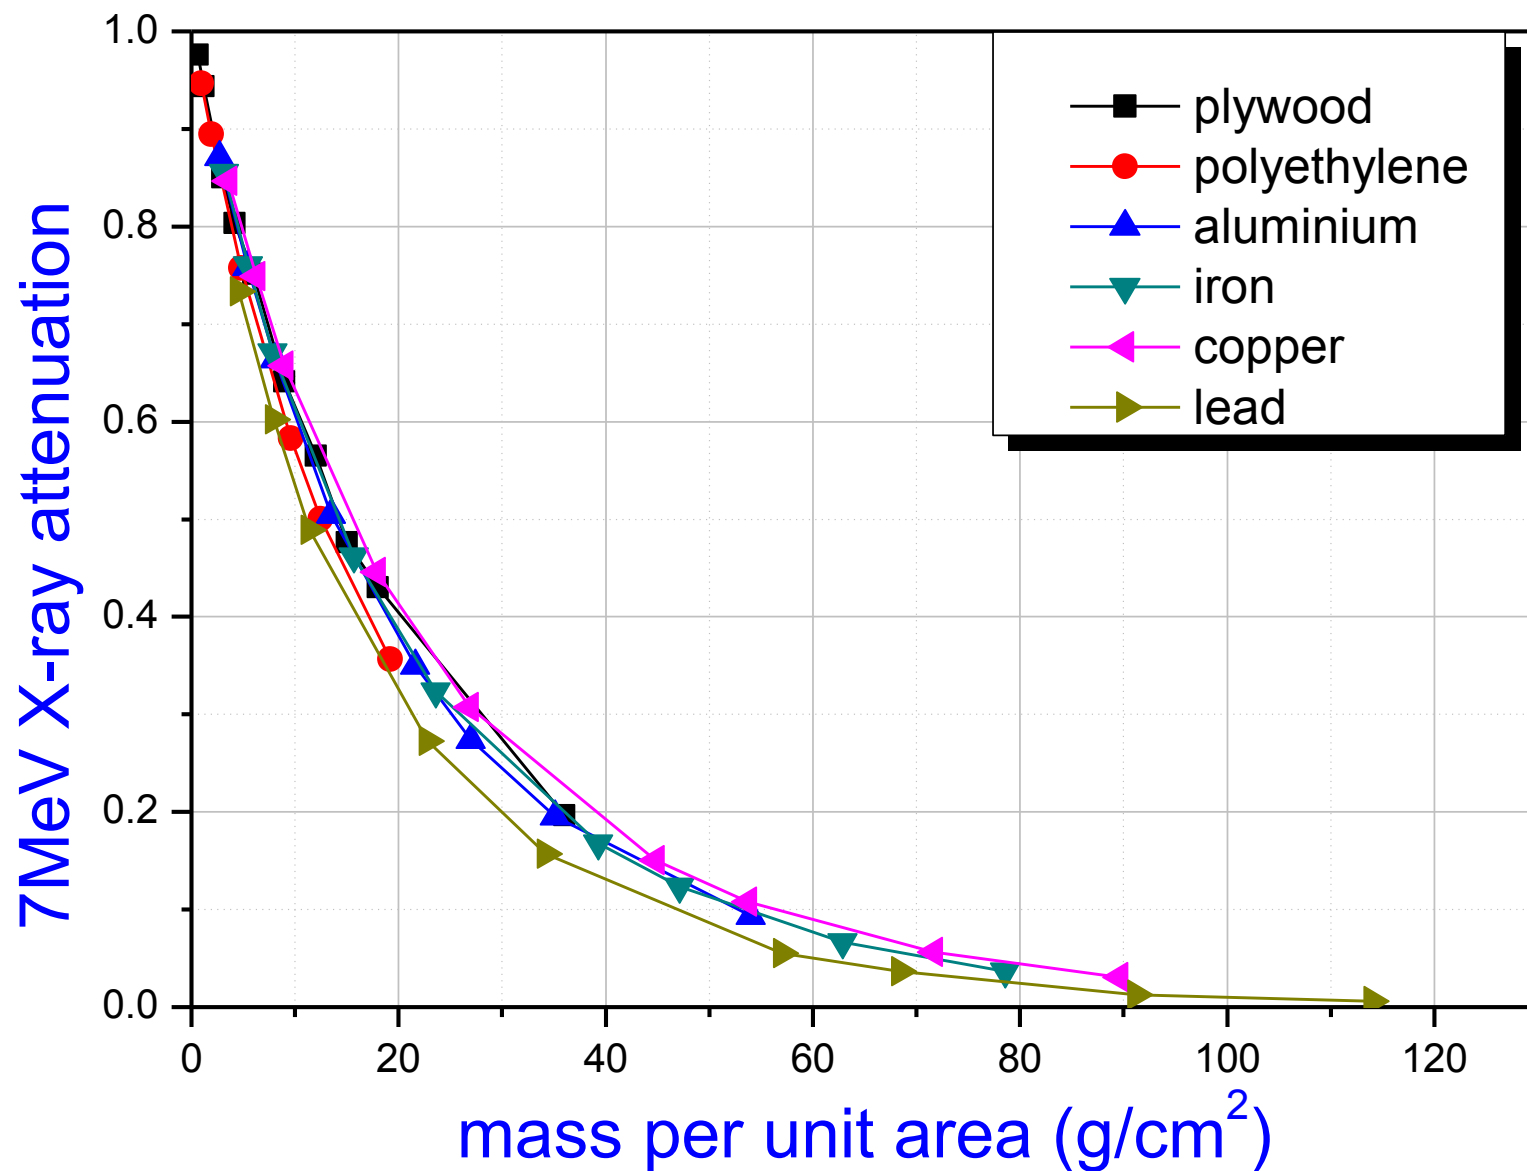

# MV X-ray imaging

**constant in MeV region** for **Compton scattering** is the dominating interaction

$$\ln \left( \frac{I_0}{I_D} \right) = N \cdot \sigma \cdot D = \mu_m \cdot t_m \propto t_m$$

# The same mass thickness $\longleftrightarrow$ the same attenuation

# More information is needed for the contrabands detection

- In the traditional MV X-ray imaging system, **mass-thickness** is the only acquired information, which is not enough to indicate the existence of contrabands.
  - *Explosives, Drugs, and SNMs (Special Nuclear Materials)*
- **Fusion of different information** of various technologies is needed to locate and identify contrabands.
- **Integrating different physics** within one system can reduce the system complexity.

# Outline

1. Research motivation

**2. e-LINAC based materials detection**

① High-Z materials detection with photons

② High-Z materials detection with photoneutrons

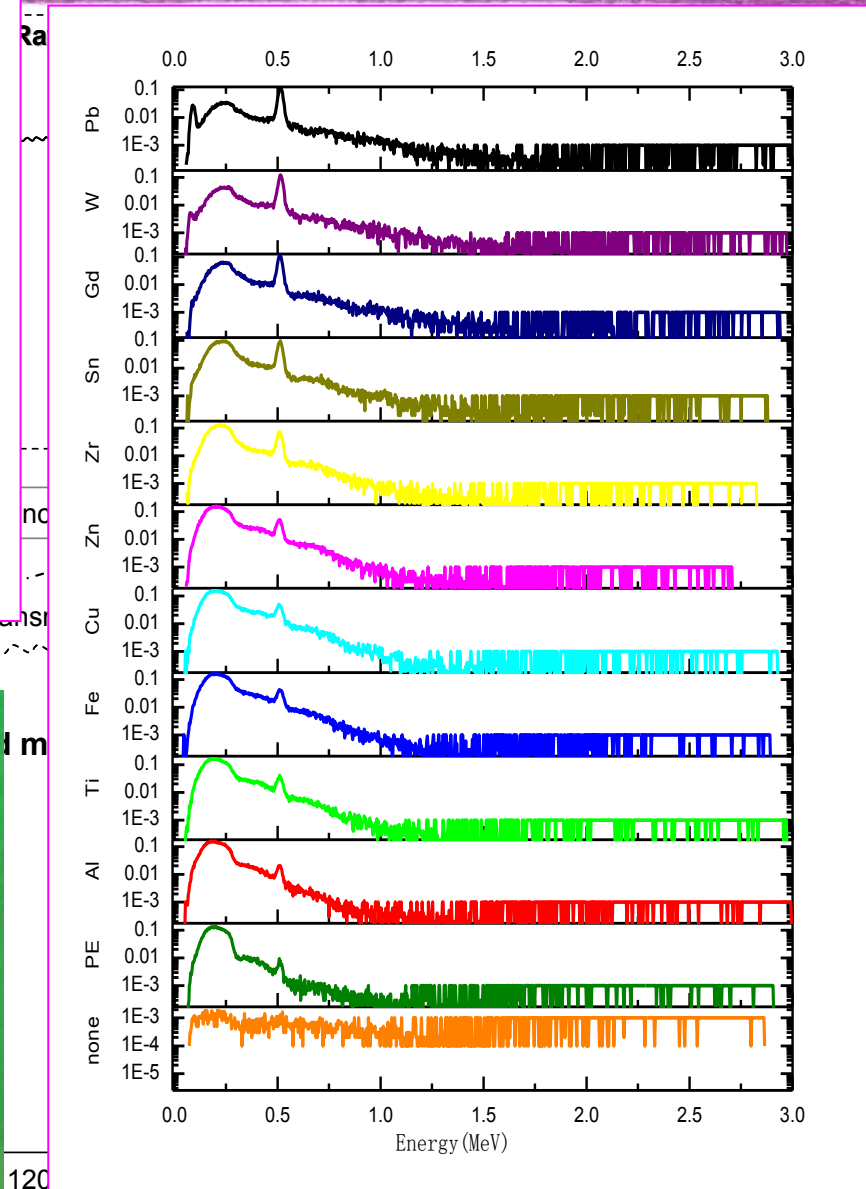

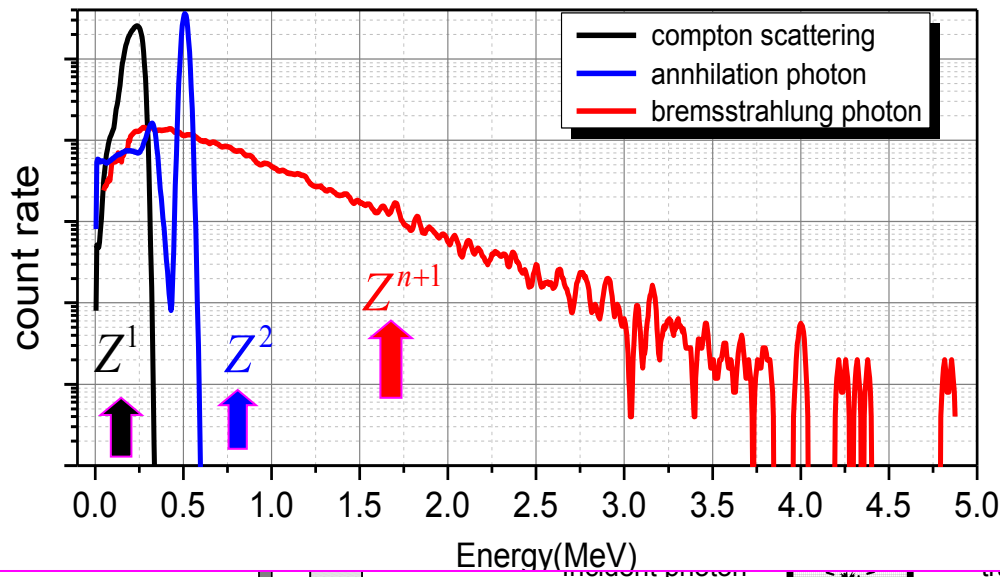

③ Explosives or Drugs detection

3. Summary

# Dual-energy X-ray imaging

# Scattering X-ray analysis

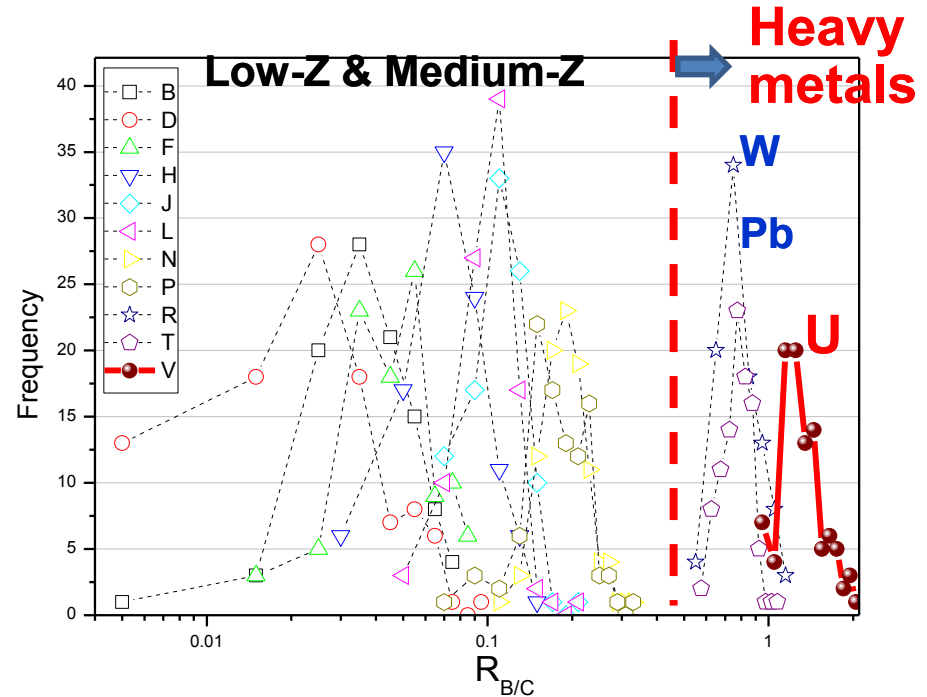

spectra

# by analyzing the scattering X-ray spectra, Z information can be acquired

Experimental results of 1 second measurement with a 7 MeV e-LINAC

Yigang Yang, Weiqi Huang, and Yuanjing Li,  
 "Measurement of Atomic Number by MV X-Ray  
 Scattering Spectra Analysis," *IEEE TRANSACTIONS  
 ON NUCLEAR SCIENCE*, vol. 60, p. 5, 2013.

# Outline

1. Research motivation

**2. e-LINAC based materials detection**

① High-Z materials detection with photons

② High-Z materials detection with photoneutrons

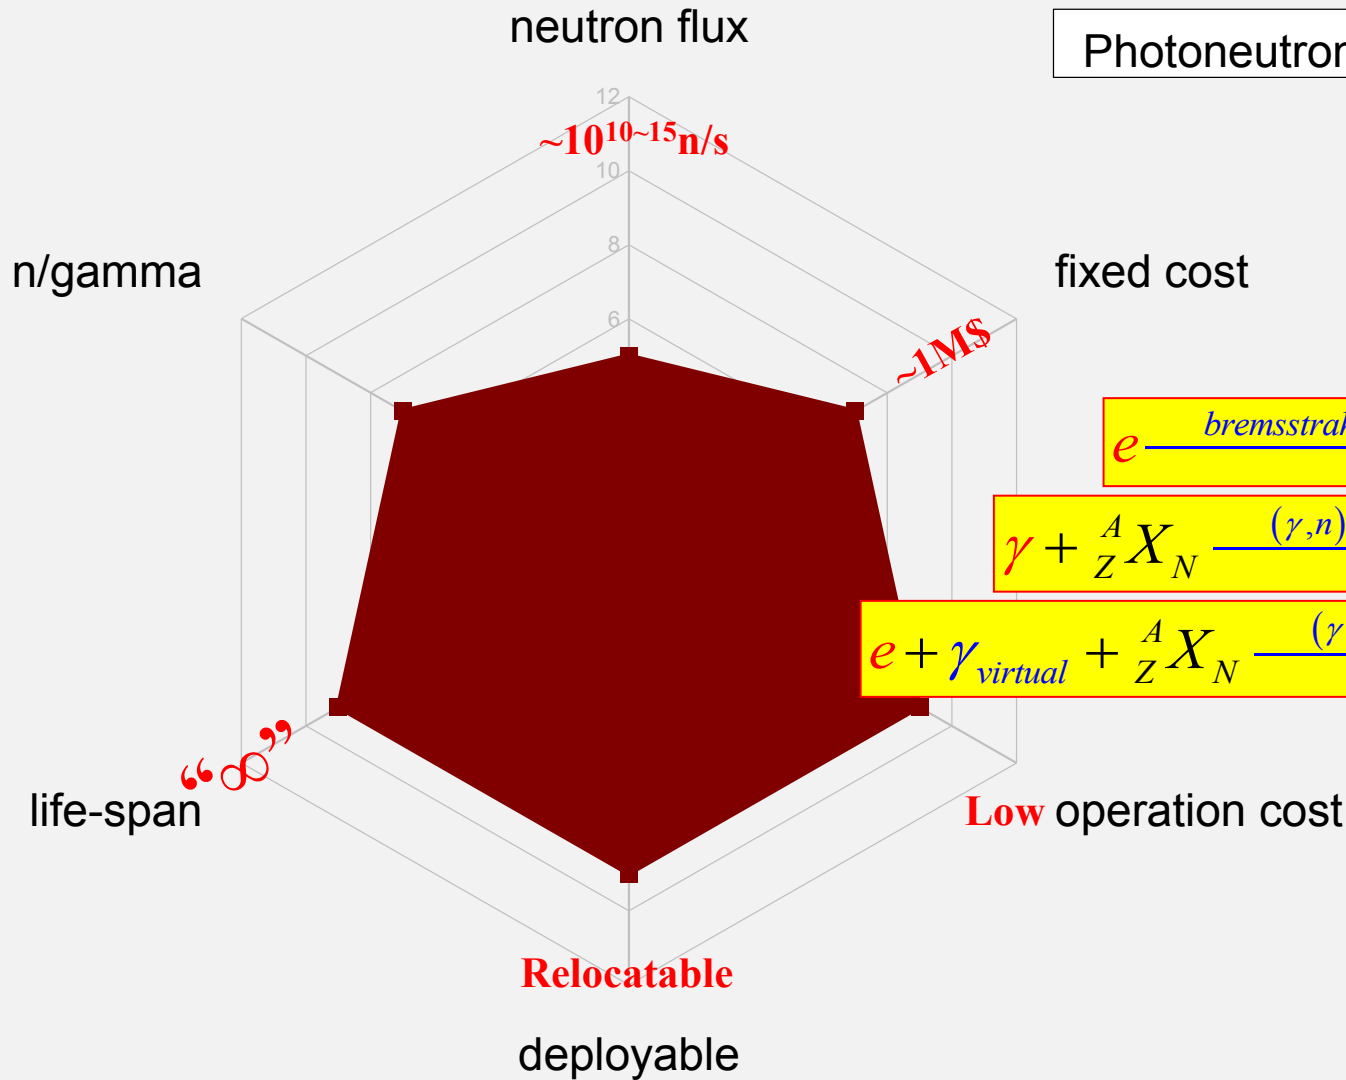

③ Explosives or Drugs detection

3. Summary

# Fermion and neutral particle

- **Neutron:**
  - Neutral particle: **Penetrating capability**
  - Fermion: **Pauli exclusion principle** → **Nuclear Structure**
- **More information** about contrabands can be provided by neutron related reactions.

# Why e-linac driven neutron source?

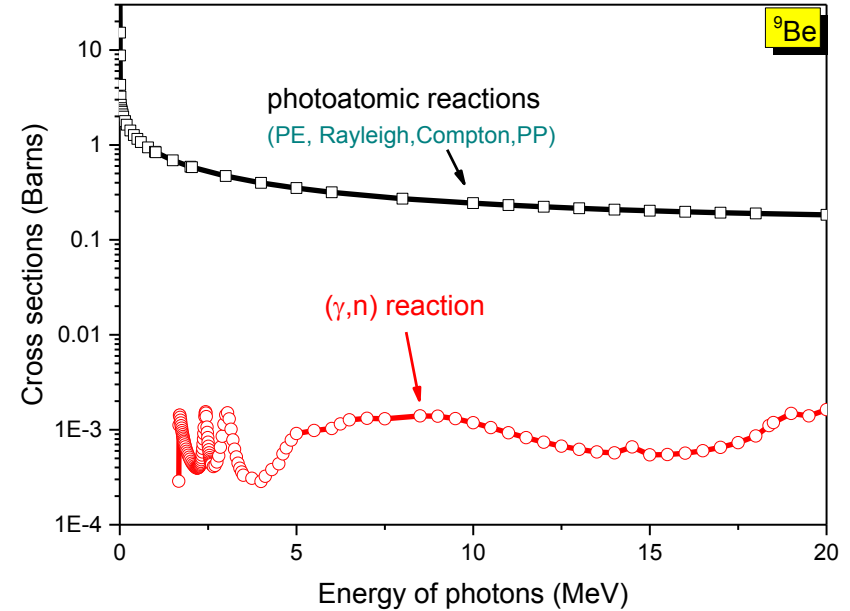

Photoneutron source generator

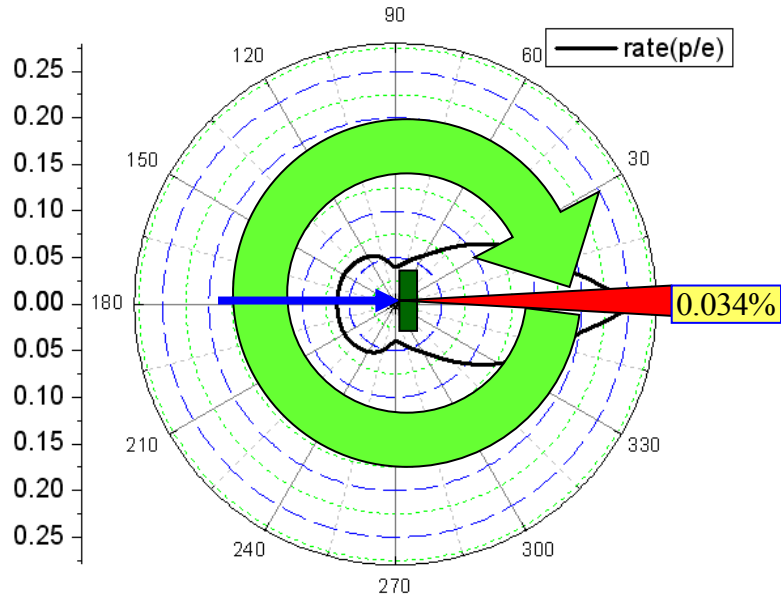

Low operation cost

# photoatomic or photonuclear reactions

# Photons → Neutrons

Angular distribution of X-ray

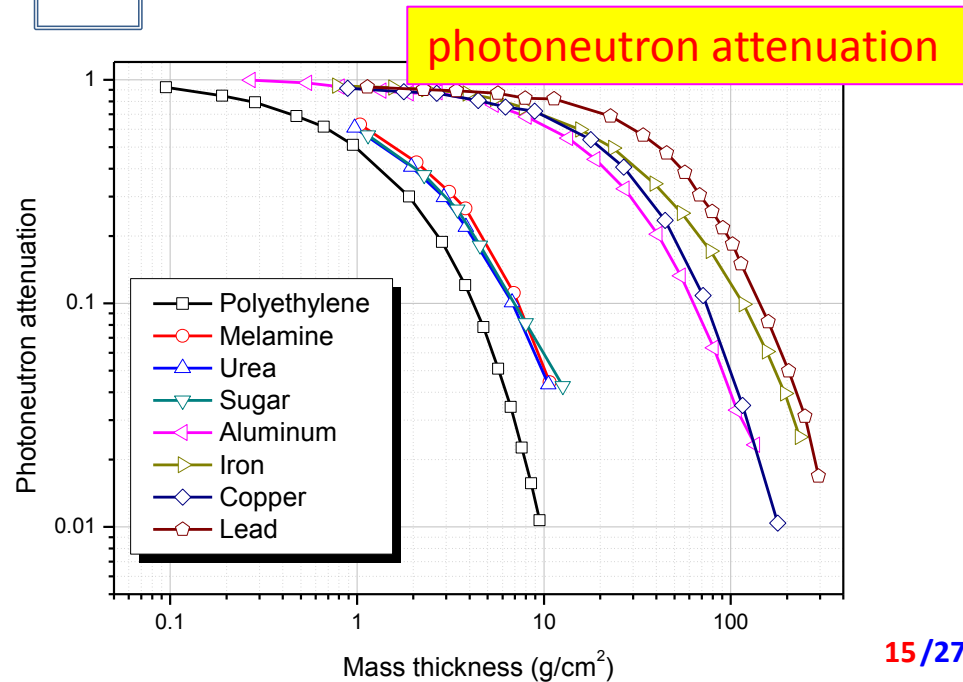

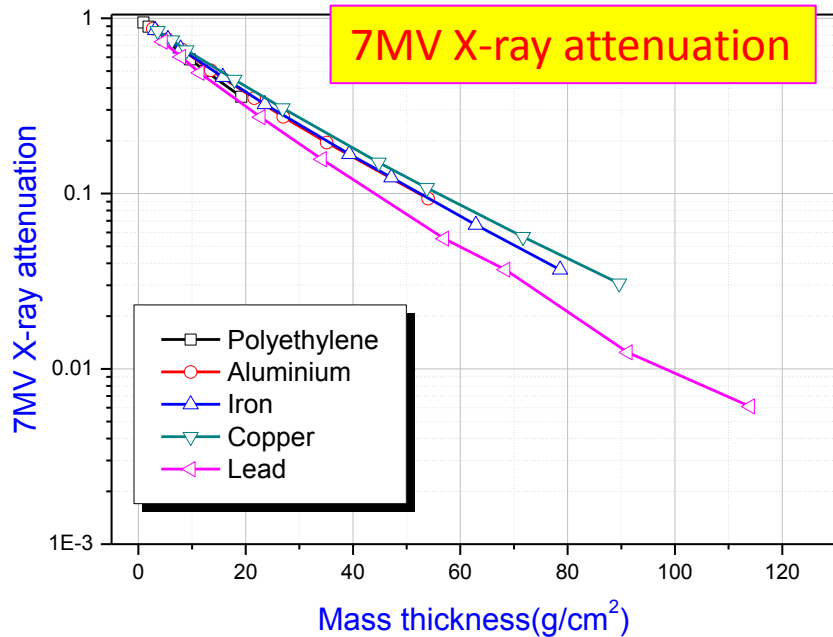

- **Photoneutron yield**

- 7MeV/100W :  $10^{10}$  n/s
- 10MeV/20kW :  $6.7 \times 10^{12}$  n/s

# PhotoNeutron X-ray Radiography (PNXR)

# Fused X-ray image and Photoneutron image

X-ray image

Photoneutron image

$$V(t) = \frac{\ln\left(\frac{I_n(t)}{I_n(0)}\right)}{\ln\left(\frac{I_X(t)}{I_X(0)}\right)} = \frac{\mu_n(t) \times t}{\mu_X(t) \times t} = \frac{\mu_n(t)}{\mu_X(t)} = \frac{\sigma_n(t)}{\sigma_X(t)}$$

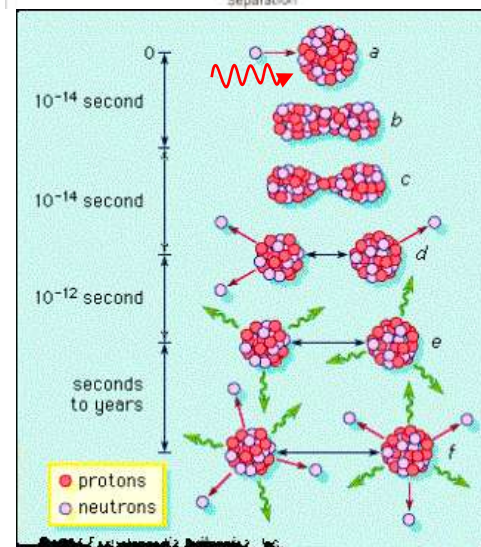

Fused PNXR image

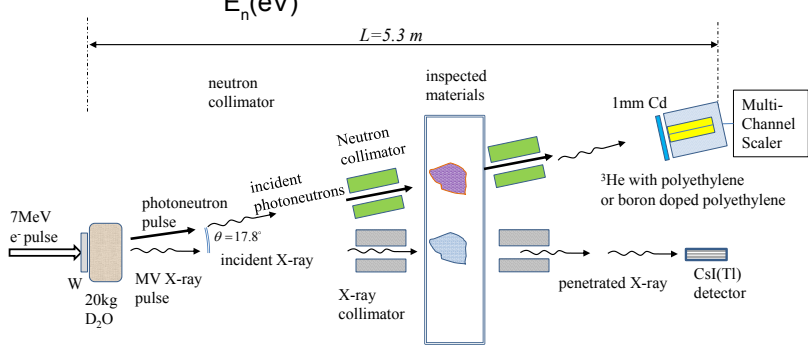

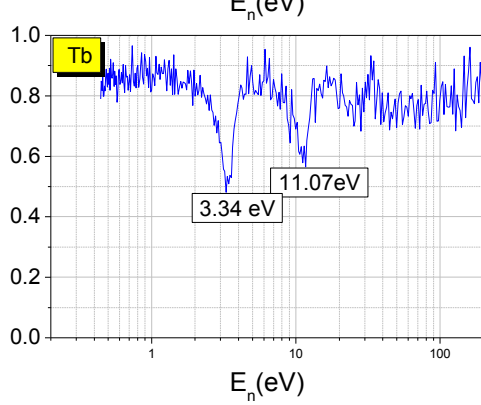

# Beta-delayed neutrons after the ( $\gamma$ , fission)

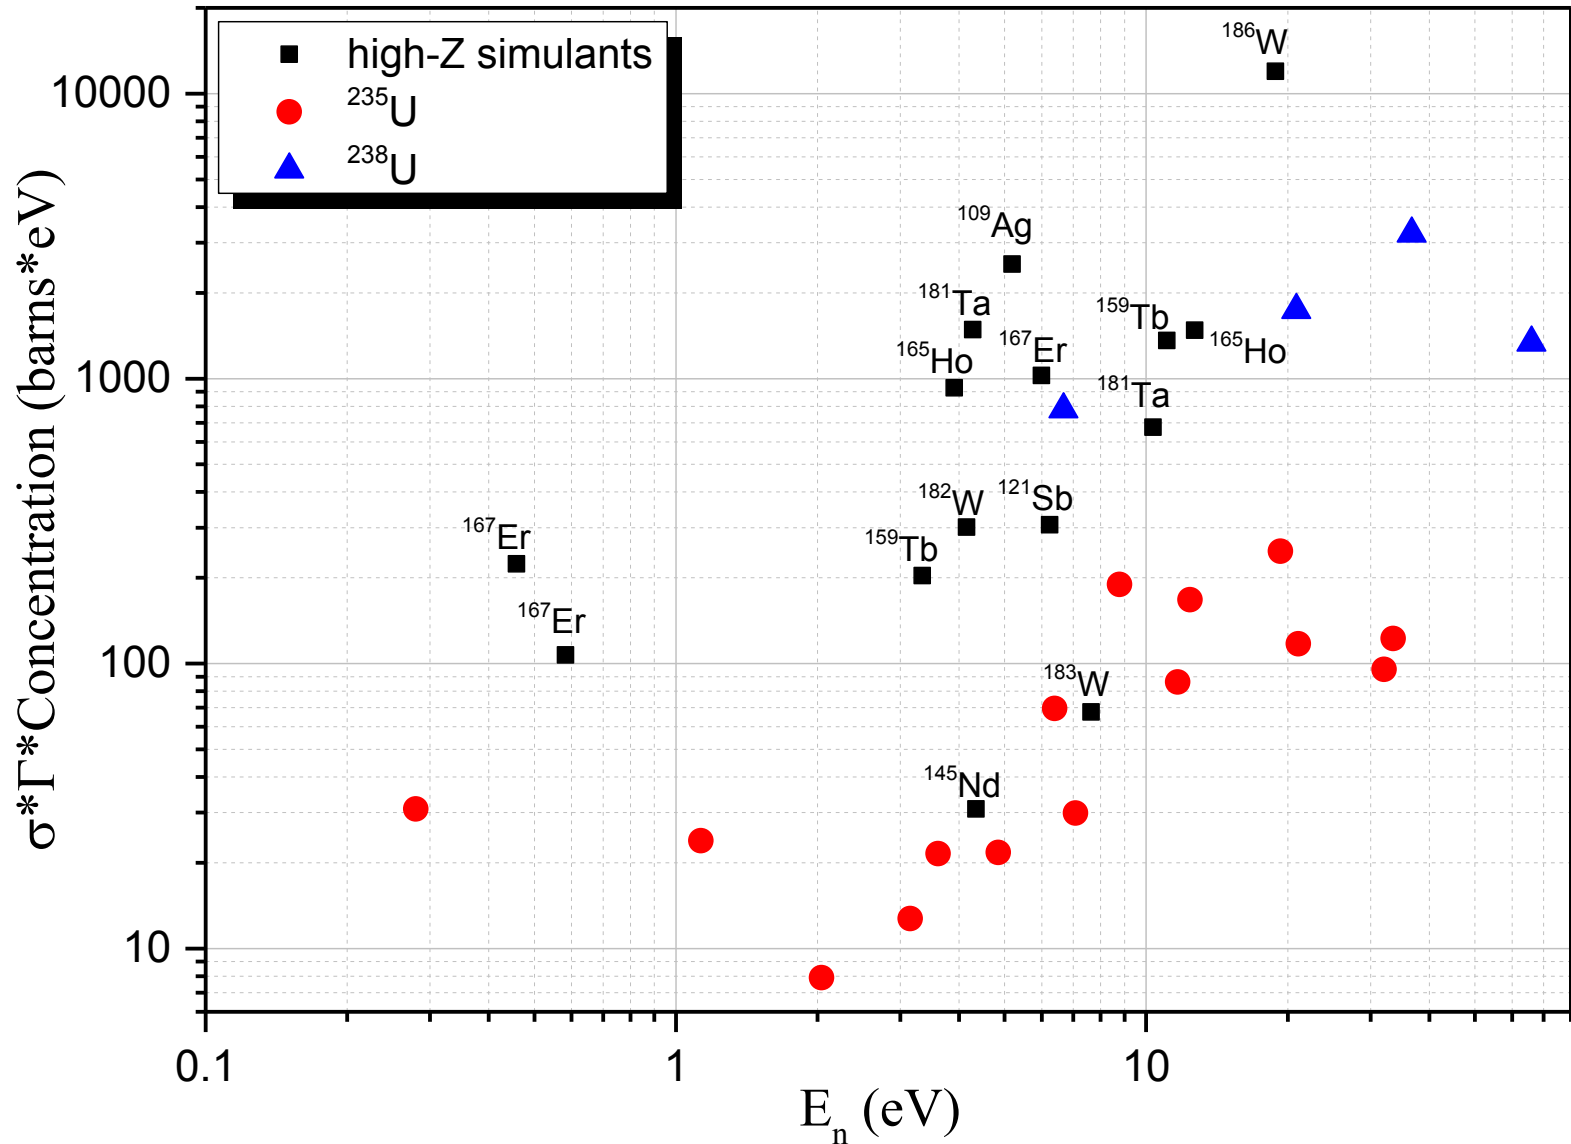

delayed  
neutrons of  
 $U^{235}$

# Isotopes identification through photoneutron resonant attenuation

# Sensitivity & energy range

# Steps for locating and identifying SNMs

# Outline

1. Research motivation

**2. e-LINAC based materials detection**

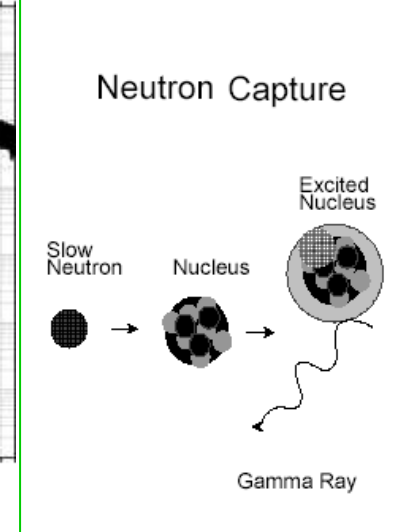

① High-Z materials detection with photons

② High-Z materials detection with photoneutrons

**③ Explosives or Drugs detection**

3. Summary

# (n, $\gamma$ ) analysis for explosives or drugs

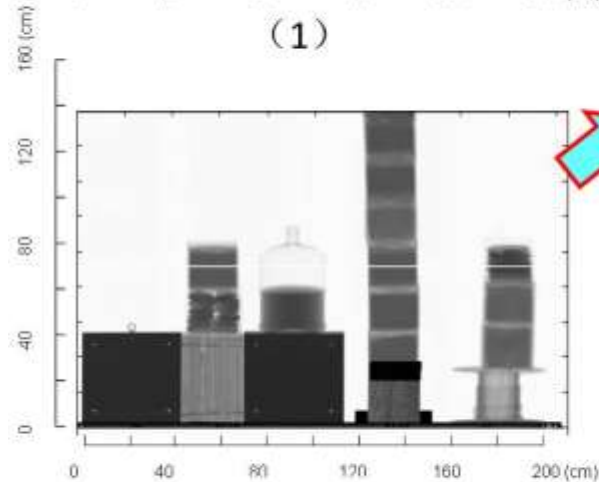

# Fusion of X-ray image and elemental concentration distribution

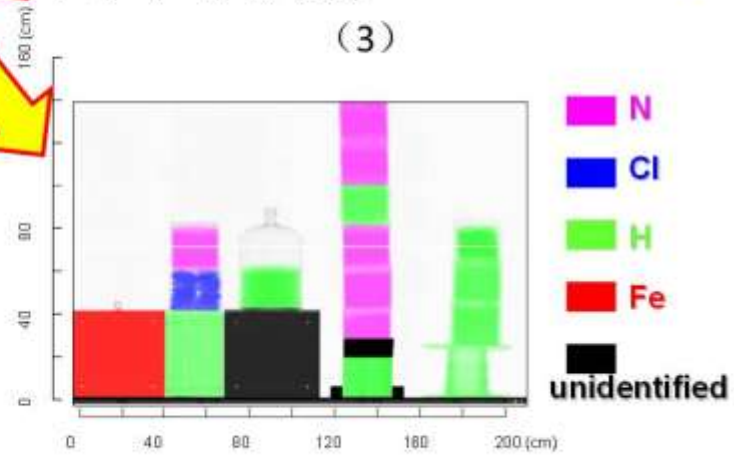

(1)

(3)

(2)

(4)

# Drugs or explosives detection system

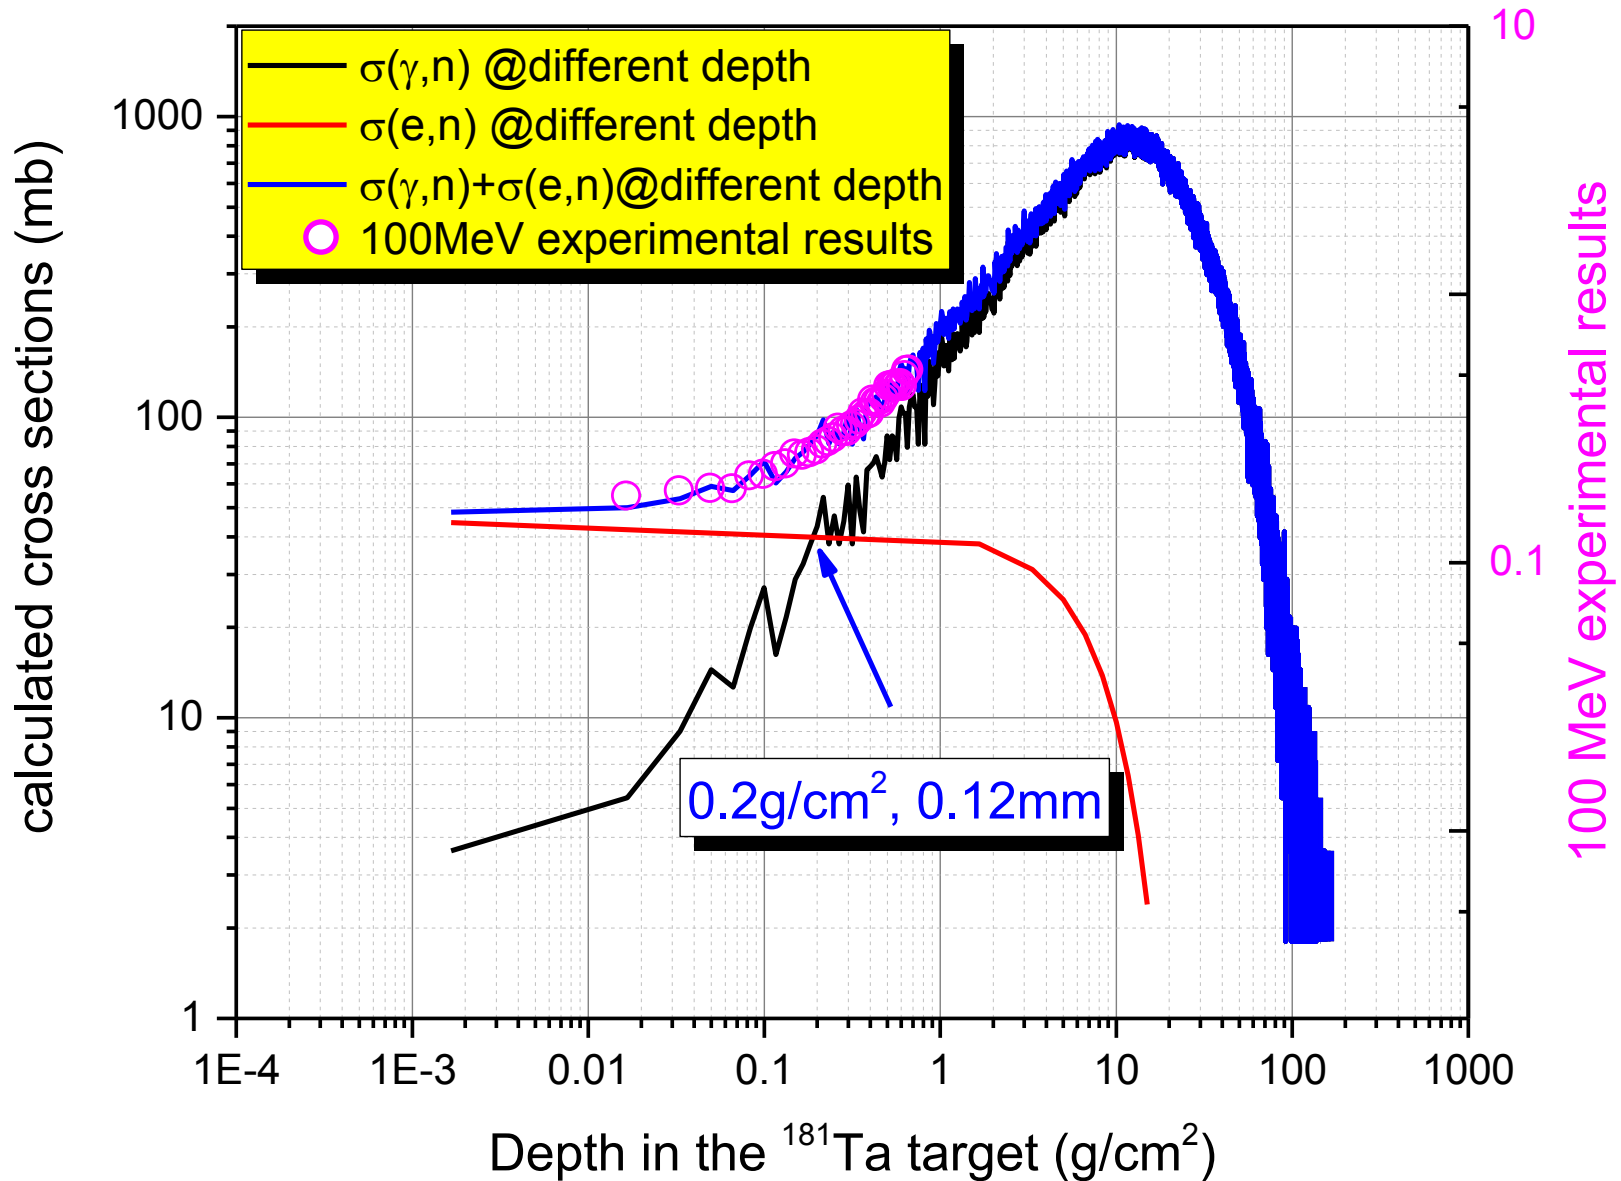

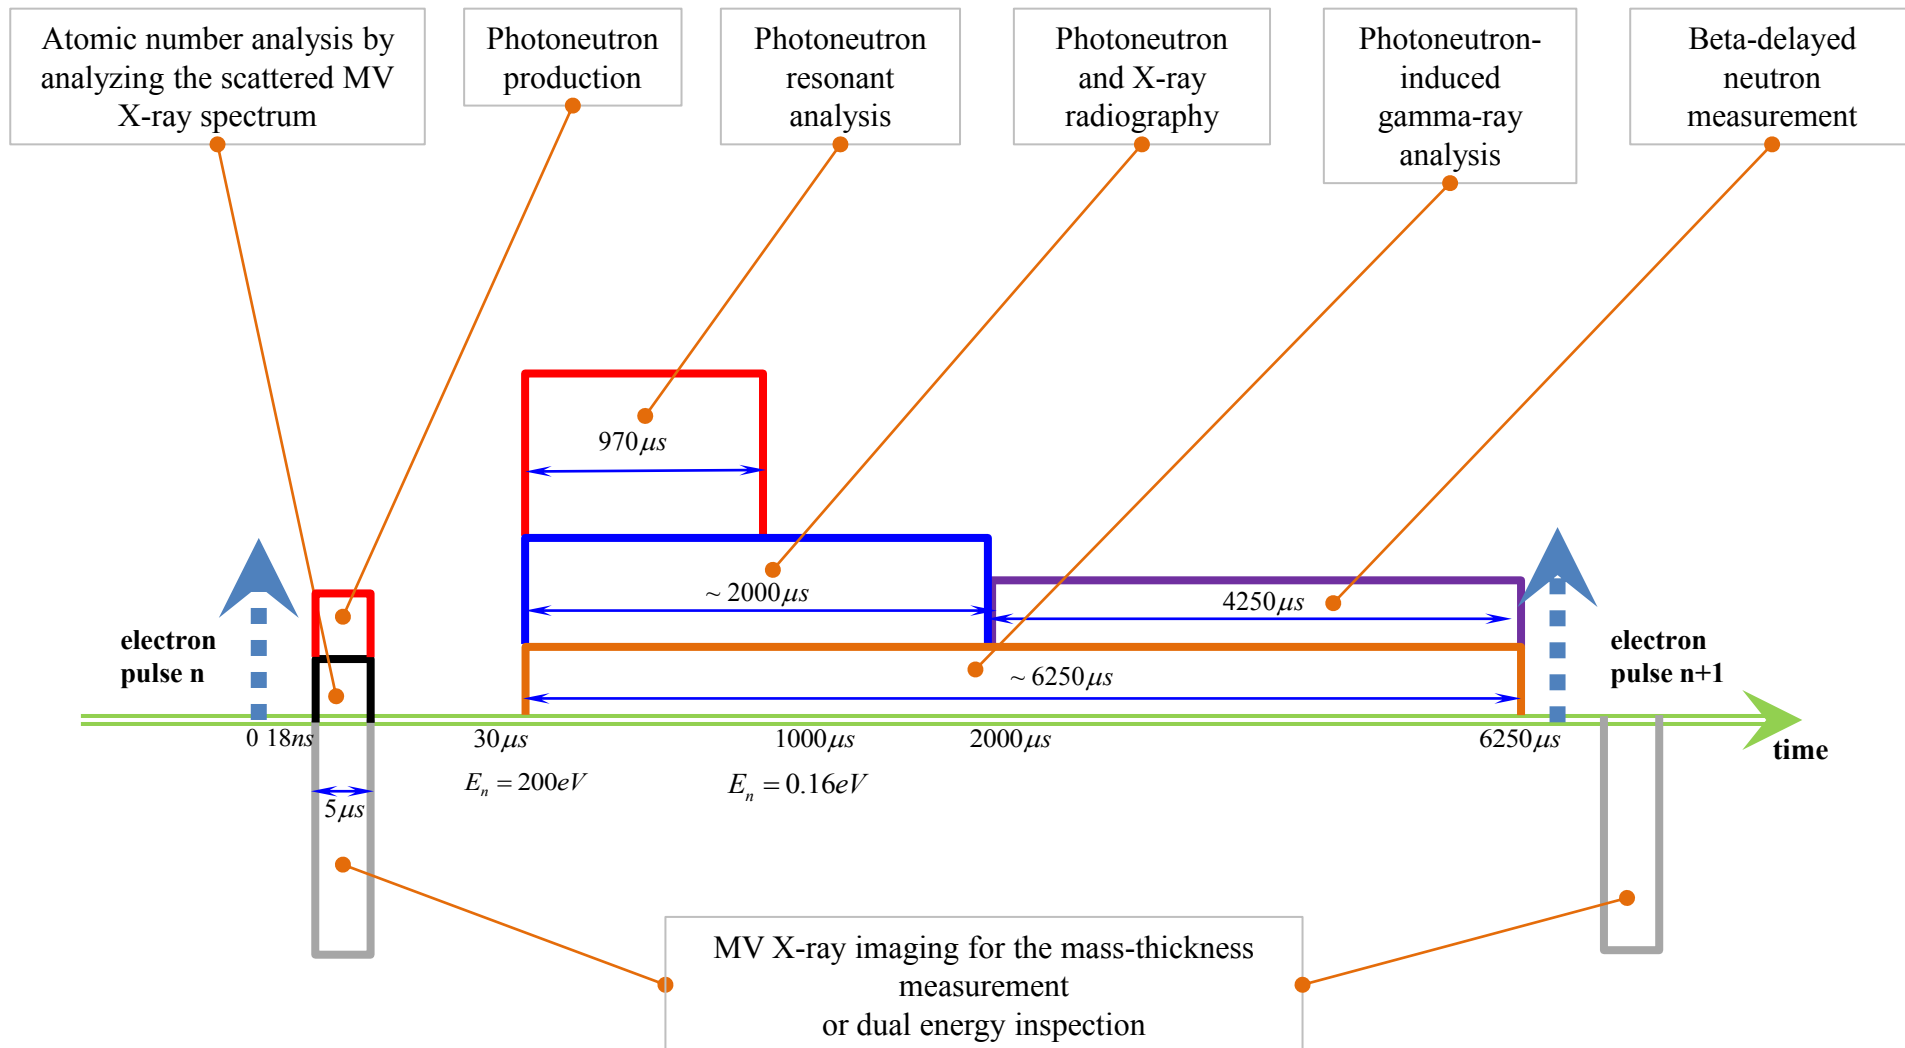

# 3. Summary

- An e-LINAC can produce both X-rays and photoneutrons simultaneously.
- Properties of the photoneutron source:
  - **High neutron yield**
  - **Long life-span & Robustness**
  - **Relocatable** and suitable for the **field use**
  - **Pulsed mode**, enabling the energy selective methods
- The philosophy of “**one-source, two-radiation, multi-physics**” can be supported by the e-LINAC driven photoneutron source to enhance the contrabands detection capability.
- Coulomb excitation of high energy electrons may result in interesting interactions and should be investigated.

# 100MeV e- vs $^{181}\text{Ta}$

# “one-source, two-radiation, multi-physics” for the contrabands detection
