The cross-section function for the 115 In(γ ,2n) 113m In reaction was determined in the energy range up to 23 MeV. Measurement was done using the bremsstrahlung facility at the MT25 Microtron, JINR, Dubna. 7 Indium disks were irradiated with bremsstrahlung spectra at endpoint energies of 17 MeV, 18 MeV, 19 MeV, 20 MeV, 21 MeV 22 MeV and 23 MeV. Induced saturated activity of 113m In was obtained with gamma spectroscopic measurement. To the determinate the cross-section function in the wide-energy photon beam the unfolding technique was applied. The obtained results were compared with TALYS 1.9 calculations and existing experimental data.
